

AMENDMENTS TO THE CLAIMS:

Please amend claim 1, and add new claims 14-18, as shown below.

This listing of claims will replace all prior versions and listings of claims in the Application:

Claim 1 (currently amended): A method for driving a plasma display panel in which any one of a scanning electrode and a sustaining electrode is shared by neighboring display cells interposed therebetween, the method comprising the step of:

changing at least one condition selected from the group consisting of a voltage of a sustaining pulse, a pulse width of a sustaining pulse, and a pulse applying interval of a sustaining pulse in relation to a polarity of said sustaining pulse, said sustaining pulse being applied to said scanning electrode and sustaining electrode by a predetermined number with relation to an image data during a sustaining period,

05 COMT
wherein on both sides of one of the sustaining electrode or the scanning electrode, the other one of the sustaining or scanning electrode is arranged, and two of the other one of the sustaining or scanning electrode are arranged between each of the one of the sustaining or scanning electrode.

Claim 2 (original): The method for driving a plasma display panel according to claim 1, wherein said changing at least one condition comprises the step of, in case of an interlace method, making a width of said sustaining discharge pulse when said shared electrode functions as a positive electrode wider than that when said shared electrode functions as a negative electrode.

Claim 3 (original): The method for driving a plasma display panel according to claim 1, wherein said changing at least one condition comprises the step of, in case of an interlace method, making a width of said sustaining discharge pulse when said shared electrode functions as a positive electrode narrower than that when said shared electrode functions as a negative electrode.

Claim 4 (original): The method for driving a plasma display panel according to claim 1, wherein said changing at least one condition comprises the step of, in case of an interlace method, making a difference in potential between row electrodes when said shared electrode functions as a positive electrode larger than that when said shared electrode functions as a negative electrode.

Claim 5 (original): The method for driving a plasma display panel according to claim 1, wherein said changing at least one condition comprises the step of, in case of an interlace method, making a difference in potential between row electrodes when said shared electrode functions as a positive electrode smaller than that when said shared electrode functions as a negative electrode.

Claim 6 (original): The method for driving a plasma display panel according to claim 1, wherein said changing at least one condition comprises the step of, in case of a progressive method, making a width of said sustaining discharge pulse when said shared electrode functions as a positive electrode narrower than that when said shared electrode functions as a negative electrode.

Claim 7 (original): The method for driving a plasma display panel according to claim 1, wherein said changing at least one condition comprises the step of, in case of a

progressive method, making a difference in potential between row electrodes when said shared electrode functions as a positive electrode smaller than that when said shared electrode functions as a negative electrode.

Claim 8 (original): A method for driving a plasma display panel in which any one of a scanning electrode and a sustaining electrode is shared by neighboring display cells interposed therebetween, the method comprising the step of:

assigning one or more sub-fields with an interlace method in which lines emitting light are changed in each field, and one or more sub-fields with a progressive method in which all lines emit light, in a plurality of sub-fields constituting one field.

Claim 9 (original): The method of driving a plasma display panel according to claim 8, further comprising the steps of:

making a width of said sustaining discharge pulse when said shared electrode functions as a positive electrode wider than that when said shared electrode functions as a negative electrode, in case of said interlace method; and

making a width of said sustaining discharge pulse when said shared electrode functions as a positive electrode narrower than that when said shared electrode functions as a negative electrode, in case of said progressive method.

Claim 10 (original): A method for driving a plasma display panel in which any one of a scanning electrode and a sustaining electrode is shared by neighboring display cells interposed therebetween, the method comprising the step of:

executing sustaining discharge of said neighboring display cells at an interval of one cycle alternately.

Claim 11 (original): The method for driving a plasma display panel according to claim 10, further comprising the step of

changing at least one condition selected from the group consisting of a voltage of a sustaining pulse, a pulse width of a sustaining pulse, and a pulse applying interval of a sustaining pulse in relation to a polarity of said sustaining pulse, said sustaining pulse being applied to said scanning electrode and sustaining electrode alternately in every cycle by a predetermined number with relation to an image data during a sustaining period.

Claim 12 (original): The method for driving a plasma display panel according to claim 11, wherein said changing at least one condition comprises the step of making a width of said sustaining discharge pulse when said shared electrode functions as a positive electrode wider than that when said shared electrode functions as a negative electrode.

Claim 13 (original): The method for driving a plasma display panel according to claim 11, wherein said changing at least one condition comprises the step of making a difference in potential between row electrodes when said shared electrode functions as a positive electrode larger than that when said shared electrode functions as a negative electrode.

Claim 14 (new): The method for driving a plasma display panel according to claim 2, wherein when the width of said sustaining discharge pulse to be applied to one of said sustaining electrode and said scanning electrode when that electrode functions as a positive electrode is wider than when said electrode functions as a negative electrode, the width of said sustaining discharge pulse to be applied to the other one of said sustaining electrode or said scanning electrode when the other one of the sustaining electrode or the scanning electrode functions as a
